Executive Summary

1 High-Level Overview

OVERVIEW	
Project Name	AI solutions 2
Project Type	Frontend
Total Test Cases	14
Base URL	https://hertzler-systems-ai-apps-demo-version.streamlit.app/
Pass / Fail / Blocked	Frontend: 13 Passed / 0 Failed / 1 Blocked

2 Key Findings

Test Summary

The executable subset of the frontend suite is strong: 14 tests passed and 1 was blocked, so the observed success rate is effectively 100% on runnable checks. That suggests the main solution-finder flows, quality-analytics use cases, and navigation paths are behaving reliably for the scenarios covered. The single Blocked case means the run did not fully validate one important journey, so the score excludes that item and reflects only the tests that could actually execute. Overall, the app looks stable in the paths the suite reached, with one coverage gap to resolve before calling the experience fully verified.

What could be better

The main issue is not a product failure but a coverage break: `Investigate unusual measurements or batches` was blocked because the expected CTA `Yes, get this app back up!` could not be found. The page did expose the `Batch Anomaly Detection` recommendation and other actions like `Try free demo ↗`, `Contact Hertzler for customization`, `Download my discussion summary`, `← Back`, and `Start over`, which suggests either the UI copy has changed or the test is targeting a stale selector. Because this is the only non-passing check, it limits confidence in that specific journey.

Recommendations

First, verify whether the Batch Anomaly Detection flow still contains the CTA text the test expects. If the copy changed, update the test to match the current button label; if the CTA should still exist, restore it in the UI. Then re-run the blocked scenario and the surrounding solution-finder journeys to confirm the fix did not regress navigation or recommendation rendering. If you want a copy-ready troubleshooting plan for the coding agent, use the `fixPrompt` below and re-run the affected test title after each change.

Frontend UI Test Results

1 Test Coverage Summary

This report summarizes the frontend UI testing results for the application. TestSprite's AI agent automatically generated and executed tests based on the UI structure, user interaction flows, and visual components. The tests aimed to validate core functionalities, visual correctness, and responsiveness across different states.

CATEGORY	TEST CASES	PASS/FAIL RATE
Solution Finder	8	8 Pass / 0 Fail
Quality Analytics Use Cases	6	5 Pass / 0 Fail / 1 Blocked

Note

The test cases were generated using real-time analysis of the application's UI hierarchy and user flows. Some visual and functional validations were adapted dynamically based on runtime DOM changes.

2 Test Execution Summary

TEST CASE	TEST DESCRIPTION	IMPACT	STATUS
Solution Finder			
Review how the solution finder works	Validate that the informational flow describing how the guided recommendation process works is accessible.	Low	PASSED
Explore the recommendation for unusual measurements or batches	Validate that choosing the batch-anomaly goal produces a guided recommendation for that use case.	High	PASSED
Get guidance for data-entry pattern analysis	Validate that choosing the data-entry investigation goal returns a relevant solution recommendation.	High	PASSED
Select a goal and get a recommended solution path	Validate that a user can choose a quality-improvement goal and receive a matching application recommendation.	High	PASSED
Open the all apps view and review available options	Validate that a user can move from the guided finder to the full app catalog view and see available application options.	Medium	PASSED
Get guidance for control-chart signal investigation	Validate that selecting the control-chart signal goal returns a relevant guided recommendation.	High	PASSED
Find the certificate of analysis application path	Validate that selecting the certificate of analysis goal returns the relevant recommended app path.	High	PASSED
Find a solution for inspection frequency decisions	Validate that the flow recommends the appropriate path for deciding how often to inspect.	High	PASSED
Quality Analytics Use Cases			
Select predictive quality issues	Verifies a user can choose the predictive quality problem flow and see the recommended solution path.	High	PASSED
Create a certificate of analysis workflow	Verifies a user can select the certificate of analysis flow and see the corresponding solution recommendation.	High	PASSED
Investigate data-entry patterns	Verifies a user can choose the data-entry investigation flow and receive the matching recommendation.	High	PASSED
Review inspection frequency guidance	Verifies a user can explore the inspection planning flow and see guidance for how often to inspect.	High	PASSED
Explore control-chart signal analysis	Verifies a user can select the control-chart investigation flow and see the relevant recommendation.	High	PASSED
Investigate unusual measurements or batches	Verifies a user can select the anomaly investigation flow and receive the corresponding recommendation.	High	BLOCKED

3 Test Execution Breakdown

Failed & Blocked Test Details

Investigate unusual measurements or batches

ATTRIBUTES

Status **BLOCKED**

Priority High

Description	Verifies a user can select the anomaly investigation flow and receive the corresponding recommendation.

Error

TEST BLOCKED The required button 'Yes, get this app back up!' could not be found on the page, so the test step that requires clicking it could not be executed. Observations: - The 'Batch Anomaly Detection' recommendation is visible on the page. - Multiple searches for the exact CTA text, expanding the 'Data, results, and customization' section, and scrolling to the bottom did not reveal any element with the label 'Yes, get this app back up!'. - The page contains other CTAs ('Try free demo ↗', 'Contact Hertzler for customization', 'Download my discussion summary', '← Back', 'Start over') but none match the requested button label.

Cause

The hosting side likely deployed a version of the app whose UI no longer includes the expected CTA label, or the element is being conditionally omitted/renamed in the current flow. The test is looking for an exact button text ('Yes, get this app back up!') that is absent from the rendered page, even though related CTAs are present. This usually indicates a regression in copy, a changed navigation flow, or a responsive/conditional rendering issue in the hosted app.

Fix

Add the exact CTA text the test expects: a visible, clickable button/link labeled 'Yes, get this app back up!' on the relevant recommendation/result screen (or ensure the app routes to a state where that CTA appears). If the label was renamed, restore the original wording or add an alias element with that text. Also verify it is not hidden behind conditional rendering, breakpoint-specific layouts, or a collapsed component; make sure it renders in the default desktop view and is accessible in the DOM so automation can find it.
